

Mandible Reconstruction Using Free Fibula Flap

Since 1983, the free fibula flap gains the domains each after the other. The side effects of its harvest in site donor are well tolerated. Whereas the benefits of its implantation in site recipient are of great value.

Previously, in three reported cases, I presented some examples of its valuable contributions in plastic surgery; the maxilla, the radius bone, and the ulna bone reconstruction.

Herein, I will present another reported case concerning the mandible reconstruction using the same versatile flap. The patient is a 31-year-old female, was a victim of a gun shout. She lost the total nose, the middle portion of the maxilla, and the anterior arc of the mandible. The total left horizontal ramus, the total chin bone, and most of the right horizontal ramus of the mandible were absent; [Figures \(1\), \(2\), \(3\), \(4\), \(5\), \(6\), \(7\)](#).

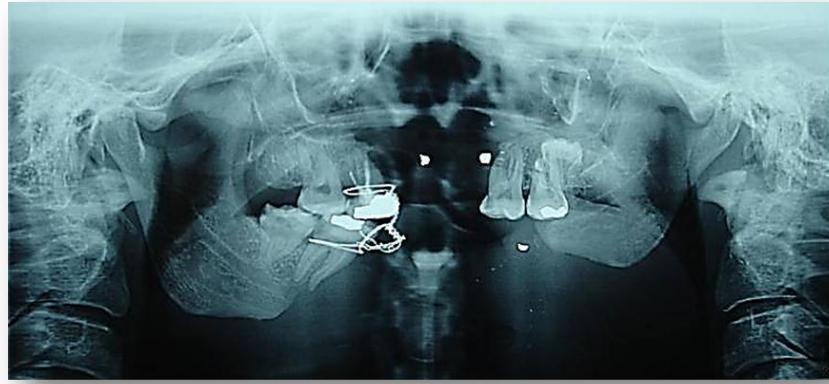

Figure (1)
Pre- Operative X- Ray

Panoramic dental X-ray reveals the bone defects in the nose, the maxilla, and the mandible.
In the mandible, the total left horizontal ramus, chin bone,
and most of the right horizontal ramus, all are absent.
